

WHAT TO EXPECT: BOTOX TREATMENT

We use several neurotoxins in office including: Dysport, Xeomin, and Daxxify. Our team will treat you with whichever is best for your pattern of movement and desired results!

KEY BENEFITS: reducing lines and wrinkles associated with dynamic movement

BEFORE YOUR TREATMENT:

- Avoid blood thinners and alcohol a few days before treatment to minimize bruising.
- Stop any vitamin E and high dose garlic supplements 1 week prior.
- Schedule at least 2 weeks prior to any special events.

DURING THE PROCEDURE:

- We'll have you animate/make faces so we can see how the muscles work. We will take your 'before' photos and then mark injection points.
- We'll gently inject neurotoxin with small needles into the marked areas with minimal discomfort.

POST TREATMENT:

- You may continue with normal facial movements.
- It is normal to have small bumps in the area of the injections directly after.
- Bruising may occur; applying ice may help to limit this.
- Avoid any other procedures on face for 24 hours (including peels, facials, or laser). Avoid massage for 24 hours after "trap-tox".
- You will start to see results in 3-7 days with full result at 14 days.

First timers- we always invite you back to the office after initial treatment to ensure optimal results. For subsequent treatments our team will reach out to you at 2 weeks to see if any additional treatment is needed for your desired result.

If you have any questions ahead of your visit please text us at 717-504-8426.
